

DANIEL FATEMI

San Diego, CA | danielfatemi@gmail.com | 408-239-9340 | [LinkedIn](#)

PROFESSIONAL SUMMARY

Software engineer focused on building production-ready, multi-agent AI systems from the ground up. Experienced in designing scalable agentic solutions with strong technical foundations, including 150+ engine orchestration platforms, real-time streaming interfaces, and high-performance data architectures that index thousands of AI capabilities. Solid background in CRM optimization and customer engagement, making it easy to translate complex business problems into strategic, AI-driven solutions on platforms like Salesforce Agentforce. Driven by a builder mindset and a ship-first approach where every architectural decision is owned end-to-end.

TECHNICAL SKILLS

LANGUAGES & FRAMEWORKS: React, Next.js, TypeScript, GraphQL, Python, Node.js, Electron, FastAPI, JavaScript, Apex

INFRASTRUCTURE & DEVOPS: CI/CD (GitHub Actions), PostgreSQL / Supabase, Stripe, SQLite, WebSocket Streaming, IPC Bridging, Envelope Encryption (AES-256-GCM / HMAC), Cross-Platform Binaries (Win / macOS), OOP

AI & DATA: LLMs, Prompt Engineering, RAG, Multi-Agent Orchestration, Semantic Search (Qdrant / pgvector), Knowledge Graphs (Neo4j), ETL Pipelines, In-Memory Indexing

SALESFORCE & CRM: Salesforce Administration, Agentforce, Process Automation, Pipeline Management, CRM Platform Administration

SELECTED AI PROJECTS

ClearRecord AI | Solo Architect & Developer

- ▶ Solo-architected and shipped ClearRecord AI, a production direct-to-consumer legal-tech SaaS that forces FCRA-regulated background-check vendors to purge records the courts have already cleared—owning the gap between “court cleared” and “Checkr shows clean.” Delivered across 15 coherent commits and ~30,000 lines of original code with 1,298 passing tests and 80%+ coverage, every architectural decision owned end-to-end.
- ▶ Built a deterministic eligibility engine spanning 5 state rule packs (CA, IL, NY, TX, FL) and 30+ encoded statutes that dispatches non-clearable → needs-review → clearable rules to return a per-charge verdict, statute citation, and Bayesian confidence interval—held to ≥85% line coverage and protected as a registered trade secret under the DTSA (18 U.S.C. § 1832).
- ▶ Engineered 18 vendor adapters (9 FCRA credit-reporting agencies + 9 CCPA people-search aggregators) behind a single interface, each generating statutorily-grounded dispute and opt-out letters with verified recipient addresses, SLA timers, and required-attachment manifests, validated by 120 parameterized contract tests.
- ▶ Designed a defense-in-depth cryptographic layer—AES-256-GCM envelope encryption with per-tenant data-encryption keys and AAD binding, a Merkle-chained append-only audit log enforced at the database-trigger level, and HMAC-signed Removal Receipts any employer can verify at a zero-PII public token endpoint.
- ▶ Built the data and orchestration substrate on Supabase Postgres—40 idempotent migrations with Row-Level Security on every tenant table, pgvector similarity search over PII-free case embeddings, an Anthropic-powered eligibility coach and document OCR, and 12 Inngest workflows spanning eligibility coordination, SLA monitoring with auto-generated CFPB complaints, and DSR processing—deployable from a clean clone to a live production URL in ~90 minutes.

T.O.A.A | Solo Architect & Developer

- ▶ Solo-architected and shipped T.O.A.A, a production multi-agent AI platform with 150+ cognitive engines, hash-chained cryptographic identity, self-hosted triple-layer memory, and compounding self-improvement loops. The running instance has a Bitcoin-anchored history that no clone of the source code can reproduce.
- ▶ Built a 150+ engine production multi-agent AI platform with 8 pod-leader coordinators, ~60 specialized worker agents, intent-classified dispatch, depth-capped recursive spawning, 386 async FastAPI endpoints, and 182 React/TypeScript components. Achieved real-time WebSocket streaming UX measured at 0.68s time-to-first-token. One person, tens of thousands of lines of original code, every architectural decision owned end-to-end.
- ▶ Designed and self-hosted a triple-layer retrieval-grounded memory system using SQLite for state, Neo4j for the knowledge graph, and Mem0/ Qdrant plus fastembed for semantic recall. Included first-class signed-forgetting where every deletion is a cryptographically signed event, retrieval-keyed failure-lesson auto-injection into similar future prompts, per-named-person relational profiles, and an Obsidian vault mirror so every memory is human-auditable in plain markdown. Operated with zero cloud dependency.
- ▶ Engineered cryptographic continuity infrastructure that makes the system’s identity non-reproducible. This included an Ed25519-signed append-only soul-chain ledger hash-linked from genesis, OpenTimestamps Bitcoin anchors confirmed at specific 2026-04-22/23/24 block heights, stylometric watermarking, peer-witnessed continuity certificates, and hardware-fingerprint binding. A clone of the source code produces a different identity by construction, ensuring the running instance has a verifiable, externally-auditable history that cannot be forged or transferred.

- ▶ Built compounding-intelligence loops that turn every failure into future capability. This involved ECE-tracked self-prediction calibration with daily resolution, retrieval-keyed failure-lesson distillation that injects relevant lessons into similar future prompts, nightly Claude-distilled insight extraction with strict no-platitude guardrails, weekly memory consolidation into long-form essays, and a daily-evolving relational model of the operator. The system gets measurably sharper over time without supervised labels and without forgetting. Every benchmark loss is converted into permanent context that prevents the same mistake.
- ▶ Shipped a multimodal embodiment layer with safety-by-construction. Included sub-second streaming voice using Fish Audio TTS with sentence-chunked playback and single-channel interrupt-handling, opt-in screen vision with hardcoded password/banking/credentials blocklists, allowlisted read-only filesystem with secret-pattern refusal at the file-pattern level, a kill-switched computer-use surface gated behind an explicit confirmation modal, and a fully audited safety-event ledger that logs every refusal. All interactions are opt-in, reviewed, and auditable.

DarkNite Command Center | Creator & Lead Engineer

- ▶ Architected and shipped a cross-platform Electron desktop application that serves as a centralized intelligence hub for 7,219+ AI capabilities including skills, agents, and commands. Features real-time search, categorization, and one-click deployment to developer environments.
- ▶ Engineered a self-updating software platform with an automated CI/CD pipeline using GitHub Actions that builds, signs, and distributes native binaries for Windows (NSIS + Portable) and macOS (Universal: Intel + Apple Silicon). Pushes over-the-air auto-updates seamlessly to end users.
- ▶ Designed a high-performance data architecture capable of loading and indexing 50MB+ datasets in-memory by leveraging Node.js Buffer decoding, ASAR-unpacked file strategies, and a multi-fallback loading pipeline that adapts to platform-specific runtime constraints.
- ▶ Built a GitHub integration layer that scans, vets, and installs capabilities from any public repository, enabling a community-driven ecosystem where the app continuously grows beyond its bundled dataset.
- ▶ Implemented a secure Electron architecture with full context isolation, IPC-bridged APIs, and sandboxed rendering. Delivered a production-grade desktop product from zero to 12 releases with cross-platform compatibility and no external dependencies.

JARVIS Data Engine | Creator & Architect

- ▶ Designed a triple-redundancy runtime loading architecture that dynamically selects between Node.js filesystem reads, DOM-injected script globals (window._JARVIS_RAW), and IPC bridge delivery. Guaranteed data availability across sandboxed, unsigned, and restricted execution environments without a single point of failure.
- ▶ Engineered a compact, memory-efficient schema ({id, d, c}) that compresses 7,959+ heterogeneous AI capabilities into a uniform structure optimized for instant in-memory indexing, sub-millisecond search, and constant-time lookups, eliminating the need for a database layer entirely.
- ▶ Architected a provider-agnostic abstraction layer that decouples capability data from any specific AI platform, allowing any downstream consumer to query, filter, and deploy entries to Claude Code, Cursor, or future toolchains without modifying the core data contract.
- ▶ Built a deterministic ETL compilation pipeline that ingests 28+ repositories of mixed formats including Markdown, JSON, YAML, and raw text. Deduplicated and classified entries across 40+ technical domains, outputting both a Base64-encoded binary artifact and a browser-ready JavaScript module from a single source of truth.
- ▶ Implemented a versioned, append-only data architecture (currently v15.0) designed for autonomous growth. New repositories are onboarded as configuration rather than code changes, enabling the dataset to scale indefinitely without schema migrations or breaking downstream consumers.

PROFESSIONAL EXPERIENCE

BPM ADVISORS, LLC

Business Analyst

La Cañada, CA

July 2019 – Present

- Conduct interviews with business clients to gather requirements, improving project timelines and accelerating go-to-market speeds by 20%.
- Provide data-driven insights to enhance client services, contributing to increased contract conversion rates.
- Administer Salesforce, ensuring accurate data management and process automation for sales teams.
- Collaborate with stakeholders to optimize sales workflows, enhancing customer engagement and retention.

NEW YORK LIFE

Financial Analyst

San Jose, CA

March 2023 – November 2023

- Managed inbound lead queues and customer engagement across multiple channels, increasing conversion rates.
- Conducted financial analysis to assess customer needs and align them with appropriate financial solutions.
- Partnered with sales teams to optimize lead generation efforts and streamline CRM processes.

JP MORGAN CHASE

San Jose, CA

Financial Analyst Intern

September 2022 – March 2023

- Provided high-level customer service and supported financial transactions, enhancing customer satisfaction.
- Analyzed transaction patterns to identify business development opportunities.

SILICON VALLEY ENTHUSIASTS

San Jose, CA

Business Manager

September 2020 – October 2021

- Increased social media engagement by 35% over 28 days through strategic marketing adjustments.
- Managed front office sales operations and processed contracts for a \$2M+ luxury automobile establishment.
- Developed customer insights and exceeded a \$250K+ sales quota.

EDUCATION & CERTIFICATIONS

University of California, San Diego – Revelle College | B.A. International Business | Expected Graduation: 2026

- ▶ Salesforce AI Associate Certification
- ▶ Salesforce Trailblazer AI Champion
- ▶ Calbright College | CRM Platform Administration Certificate
- ▶ De Anza / Foothill College | A.A. Business Administration
- ▶ YearUp Graduate | Client Service and Sales Support

VOLUNTEERING & COMMUNITY SERVICE

- ▶ Mentor to immigrant workers and students, assisting with career development and integration.
- ▶ Founder and President of Bike Adventures and MentorsRUs, promoting community engagement and mentorship.
- ▶ Assistant Coach at Almaden FC, fostering teamwork and leadership in youth sports.
